MIDTERM EXAM II

11/96 Prof. Powers

- This exam is open book and notes.
- There are three problems; each is equally weighted.
- Partial credit will be given; be sure to do some work on each problem.
- Be sure to include units in your answers.
- Please circle or underline your answers.
- Do *NOT* do any work on this sheet.
- Show *ALL* work.
- Enter your name in the space provided.

Name: _____

A laser material with an index of refraction of 1.2 has the energy level diagram shown below. The transition from level 2 to level 1 is lifetime broadened.

Level	E(eV)	
3	3.5	———— $\tau_3 = \tau_{32} = 1.2 \text{ ns}$
2	2.0	———— $\tau_2 = \tau_{21} = \tau_s = 1.3 \text{ ms}$
1	1.2	———— $\tau_1 = \tau_{10} = 1.1 \text{ ns}$
0	0	————

Figure 1: Information for Problems 1 and 2.

-
- Find the three Einstein coefficients for the radiative transitions between level 2 and level 1 for the material with the properties described above.

-
- Consider the material above. If the unsaturated gain coefficient, β_0 , is $3,000 \text{ m}^{-1}$ when $\nu = \nu_0$, find the (saturated) gain coefficient when the irradiance level in the material is $1,200 \text{ W/m}^2$.

-
- A laser's optical gain medium (****NOT**** the one described above) operates at a wavelength of $1.06 \mu\text{m}$, has an index of refraction of 1.5, and a length of 25 cm. If the left mirror of the laser is 100% reflecting and the output mirror transmissivity is 95%, the output irradiance of the laser is found to be 1% of the value of the saturation irradiance of the laser. The unsaturated gain coefficient of the material has a value of $5,000 \text{ m}^{-1}$. (**Added information: The given numbers in the problem give a $T > 1$. For a more realistic answer, assume that the output irradiance is 40% of the saturation irradiance when the output mirror is 95% transmitting and that the unsaturated gain coefficient has a value of 1 m^{-1} .**)

Find the value of optimum reflectivity of the output mirror.
